High-resolution anatomical images

T1- and T2-weighted anatomical images with a voxel-size of 0.7 mm for all participants.

[View details »](#)

The human brain is designed to process vast amounts of input that are continuously gathered through the senses. However, most experiments study the brain via simplified stimuli that do not resemble the complexity of a natural environment — a mismatch that needs to be addressed in order to better understand how the brain works. This project aims to provide essential components to enable inter-disciplinary research to study the brain's natural behavior and the versatile interactions of concurrent cognitive processes in everyday life.

Challenge

Studying neural processing in real-life, rich natural environments requires adequate **data**, tested analysis **strategies**, and proven software **tools** that are capable deciphering brain activity pattern elicited by multiple concurrent neural processes.

[View details »](#)

Resources

We provide **extensive functional brain imaging data** from natural stimulation, a rich set of auxiliary data, (such as structural brain scans, measurements of physiological, and technical confounds), as well as stimulus annotations.

[See overview »](#)

Access

All data and software components are publicly available. There is no required sign-up or registration procedure. Data are released under an extremely permissive license and can be used by academic and commercial entities.

Grand Challenges in Biomedical Image Analysis

All Challenges

Here is an overview of all challenges that have been organized within the area of medical image analysis that we are aware of. If you know any study that would fit in this overview, please let us know by filling out [this form](#).

Workshop: Sep 14, 2014

Brain Tumor Image Segmentation (BraTS 2014)

Contains three sub-challenges. 1: Segmentation of brain tumor (GBM) and its components, 2: Longitudinal Evaluation of time series image data and 3: Classification into Low- and High Grade (GBM) gliomas.

[Open for submissions](#)
[Data download](#)
Associated with: [STN 2014](#)

Subthalamic Nucleus Segmentation Challenge 2014

This challenge seeks to bring together leading academic researchers to tackle the difficult problem of Subthalamic Nucleus (STN) segmentation in MRI volumes. Sponsored by Renishaw plc and organised by Aberystwyth University.

[Open for submissions](#)
[Data download](#)
Workshop: Sep 14, 2014
Associated with: [MICCAI 2014](#)

Brain Tumor Digital Pathology Challenge

Evaluation of classification of LGG and GBM, and segmentation of necrotic and normal brain regions from high-res digital pathology slide clinical cases.

[Data download](#)
Workshop: Sep 12, 2014
Associated with: [ECCV 2014](#)

Leaf Segmentation Challenge

To advance the state of the art in leaf segmentation and to demonstrate the difficulty of segmenting all leaves in an image of plants, we organize the Leaf Segmentation Challenge (LSC).
